CAST IN PLACE

## What is 'cast in place'?

Cast-in-place concrete work is a specialty service that offers unique advantages for contractors, designers, and architects seeking to push the boundaries of their creative vision. Unlike precast concrete elements, which are manufactured off-site and limited in their design flexibility, cast-in-place concrete allows for the creation of custom-made, one-of-a-kind structures and architectural elements.

*Saturdays NYC in Soho*

## Saturdays NYC 31 Crosby Street

Our team fabricated the service counters for both the retail and hospitality side of Saturdays NYC. We also troweled some of the floor space as well casted benches and clothing racks to create a uniform aesthetic throughout.

## What makes casting in place unique?

As a designer or architect, you understand the importance of creating distinctive spaces that reflect your artistic expression. Cast-in-place concrete work empowers you to bring your design concepts to life with unmatched versatility. By pouring concrete directly on-site, there is more freedom to mold and shape the material to fit your exact specifications. This flexibility enables the realization of complex geometries, intricate textures, and unique architectural features that would be challenging or impossible to achieve with precast elements.

Additionally, cast-in-place concrete work offers the opportunity to create truly monolithic structures. The seamless integration of concrete elements not only enhances the structural integrity of your designs but also contributes to their aesthetic appeal. The absence of visible joints or connections results in a visually cohesive and harmonious composition, adding a touch of elegance and sophistication to your architectural creations.

## Private Residence Clinton Hill, Brooklyn

The client for this project was a social media lifestyle influencer who wanted us to give her kitchen a makeover. All of the kitchen countertops were cast in place and is the 'backdrop' for many of our client's photoshoots (see above).

# Monarch Restaurant Williamsburg, Brooklyn

Cast in place bar countertops. The bar wraps all the way around onto the backbar, creating a sleek and visually impactful design.

## Classic Car Club of Manhattan New York, NY

We cast one of our largest cast in place pieces to date at the new location of the Classic Car Club. The new space was 40,000 square foot - casting in place was needed in order to execute a countertop to match the scale of the space. The results were a long continuous bar with monolithic waterfall walls.

## Private Residence Gramercy Park

Cast in place kitchen countertops with a hand troweled backsplash to match.

## And one last note...

Cast-in-place concrete work allows you to exercise greater control over the entire construction process. From selecting the optimal mix design to monitoring curing conditions and applying finishing techniques, you have the ability to fine-tune every aspect of the concrete's appearance and performance. This level of control ensures that your designs meet the highest standards of quality and align precisely with your vision.

We provide this specialty service that empowers designers and architects to realize their most ambitious and imaginative projects. Its unparalleled design flexibility, ability to create monolithic structures, and enhanced control over the construction process make it an ideal choice for those seeking to push the boundaries of creativity and deliver truly exceptional architectural experiences.
